SUMMARY

AI Engineer with a strong full-stack foundation (C#/.NET, TypeScript, Vue.js, Python) and hands-on production experience building multi-agent AI systems, LLM governance and guardrails middleware, and distributed AI platforms. Skilled in prompt engineering, LLM behavioral evaluation, event-driven architecture, and production observability. A background in English and Creative Writing sharpens both prompt design precision and the ability to translate complex AI system behavior into clear documentation for nontechnical stakeholders.

HIGHLIGHTS

- Architected a production-grade distributed AI development platform spanning multi-machine infrastructure, a cloud code execution sandbox, and a GitHub-based CI/CD pipeline at Fillory AI.
- Built LLM governance middleware covering memory, drift detection, and identity coherence across multiple live AI-powered applications at Fillory AI.
- Independently designed, built, and shipped Kitchen Keeper, a live full-stack AI app, including hybrid pgvector retrieval that reached 91% recall@5 in a custom eval harness.
- Modernized a legacy Visual Basic (2003) front end into Vue.js and led an offshore Angular team at Office Ally, a healthcare platform serving thousands of providers.

SKILLS

- **AI & Agentic Systems:** Multi-agent orchestration, LLM governance & guardrails, drift detection, prompt engineering, LLM behavioral evaluation, event-driven agent architecture, AI-assisted development (Claude, ChatGPT, Grok, Copilot), RAG / hybrid retrieval (pgvector), MCP knowledge graphs, agent guardrails via hooks
- **Front End:** TypeScript, React, Vue.js, Next.js, Angular, JavaScript, HTML5, CSS3
- **Back End:** C# / .NET, Node.js / Express, Python, SQL, REST API design & development
- **Testing & Evaluation:** LLM behavioral testing, unit & integration testing, compliance-focused test environments, CI/CD pipeline validation, test-driven development (TDD), retrieval & agent eval harnesses
- **Tooling & DevOps:** GitHub, Vercel, Octopus Deploy, Agile / Scrum, JIRA, OWASP security standards, production observability
- **Communication:** Technical specification writing, code review leadership, cross-functional stakeholder communication

EXPERIENCE

Fillory AI | Portland, OR
AI Software Engineer | Nov 2025 – Apr 2026
Early-stage AI startup building production middleware platforms, cognitive OS frameworks, and multi-agent developer tooling.

- Architected a distributed AI development platform spanning multi-machine production infrastructure, a cloud code execution sandbox, and a GitHub-based deployment pipeline.
- Built an LLM governance and guardrails middleware layer covering memory management, drift detection, and identity coherence across multiple live AI-powered applications.
- Designed event-driven architecture for an AI middleware platform (Portland Protocol), including a phase-gated event system with architect review gates, versioned event envelopes, and a retryable webhook delivery pipeline.
- Implemented semantic action normalization and hardened task state tracking in an agent system built with TypeScript and Next.js; diagnosed and resolved planner behavior regressions.
- Built process persistence and boot automation for a 17-service AI platform, replacing a manual power-cycle recovery that had previously taken 6 hours and allowing an unplanned hardware move with no data loss.
- Designed and executed LLM behavioral evaluation suites to detect agent sycophancy and drift; authored technical specifications governing AI system architecture and compliance.

Office Ally | Vancouver, WA
Software Developer | Jan 2022 – Nov 2024
Healthcare technology company providing cloud-based practice management, electronic health records, and clearinghouse solutions to medical providers nationwide.

- Served as technical lead for an offshore Angular development team, conducting code reviews and enforcing maintainable, secure, and standards-compliant front-end delivery.

- Built and validated .NET API endpoints, improving platform reliability and scalability through a structured CI/CD release workflow.
- Rebuilt the account signup flow to simplify onboarding; implemented ReCaptcha and updated encryption practices aligned with OWASP standards.
- Improved deployment processes using Octopus Deploy and built a UTC time zone converter to resolve data localization issues.
- Translated a legacy Visual Basic (2003) interface into a modern Vue.js front end, significantly improving maintainability and user experience.

Prosper IT Consulting | Portland, OR
Software Developer | Feb 2020 – Dec 2021
Technology consulting firm and coding bootcamp operator offering curriculum platforms and mentored developer pathways.

- Redesigned the full user experience for learncodinganywhere.com, including registration, navigation, progress tracking, and dark mode.
- Built dynamic progress bars, a notification system, and a drill-completion locking system for student course management.
- Created role-based subscription and free course services to support tiered access for new and existing users.

PROJECTS

Kitchen Keeper | AI-Powered Food Waste Management App | 2026
Live: kitchenkeeper.kitchen | Source: github.com/ConnorSharpe/kitchen-keeper

- Designed and shipped a full-stack household pantry management app end to end: React/Vite frontend, Node.js/Express backend on Vercel serverless functions, Postgres (Neon) with Drizzle ORM, and Clerk authentication.
- Integrated AI vision (OpenAI) for grocery receipt scanning that auto-populates pantry inventory, plus AI-generated meal suggestions targeting soon-to-expire ingredients and a conversational kitchen assistant.
- Built real-time multi-user household sharing, expiry-based prioritization, and a shopping list builder synced across pantry and recipe data.
- Hardened the production app independently: audited and pinned dependencies, removed dead auth code, added per-user rate limiting on sensitive endpoints, and diagnosed and fixed a PWA service-worker cache bug causing stale deploys for returning users.
- Designed and shipped a production observability system (Sentry) across the full stack, replacing an ad hoc client-side debug log with structured error tracking and release-tracked source maps, verified end to end against a live deployment including confirmed error delivery under concurrent serverless invocations.
- Diagnosed a suspected telemetry duplication bug by testing against a real production build rather than assuming from documentation, tracing it to a React development-mode-only code path and avoiding a fix that would have cut real error monitoring coverage app-wide.
- Added hybrid semantic retrieval to the AI assistant using pgvector in the existing Postgres database, fusing full-text and vector search (OpenAI embeddings) via Reciprocal Rank Fusion with household-scoped tenancy tested against a real database; documented in five ADRs and shipped through staging to production with a ledger-tracked migration and backfill.
- Built a retrieval and agent eval harness over golden query sets: hybrid search reached 91% recall@5 (vs. 72% full-text, 84% vector), and the agent called the new tool on 100% of target queries and none of the controls.

Governed AI Development Workflow | Claude Code Hooks, Subagents & MCP | 2026

- Designed a TDD enforcement layer for AI coding agents with Claude Code hooks: source edits blocked until a failing test is recorded, tests locked unless a human approves a rewrite via an audit-logged script, flaky tests quarantined, and sessions blocked from ending on a failing suite.
- Split agent work into role-scoped subagents (a test-writer blind to the implementation, a minimal implementer, a verifier returning only pass/fail evidence) and gave agents persistent MCP knowledge graphs for project decisions and cross-project lessons.
- Bounded agent context with architect-reviewed specs, testable acceptance criteria, and session handoff documents over chat history.
- Introduced a migration ledger after a production outage caused by a schema migration going live without its dependent code, and fixed enforcement-tooling gaps found in real use.

EDUCATION

Tech Academy | Portland, OR
Full-Stack Software Development Bootcamp Graduate

Loyola Marymount University | Los Angeles, CA
Bachelor of Arts in English: Creative Writing
